

## Day 1 —

### 1. Which response was easier to understand?

ChatGPT was easier to understand because the language was simple and clear.

### 2. Which response followed the instructions more accurately?

ChatGPT followed the instructions accurately.

### 3. Would you use either response without checking it?

No, factual information should always be verified.

### Retrieved vs Generated:

Retrieved information comes from an existing source, while generated information is newly created by AI.

## Day 1 Classification

| Situation                              | Answer             |
|----------------------------------------|--------------------|
| Flight time from official system       | Retrieved          |
| Passenger delay notification           | Generated          |
| Baggage rule from airline policy       | Retrieved          |
| Summary of baggage rule                | Generated          |
| Airport advertisement                  | Generated          |
| Passenger booking details              | Retrieved          |
| Verified flight data +<br>announcement | Both               |
| Safety-critical decision               | Human<br>judgement |
| Passenger complaint reply              | Generated          |
| Gate number from airport system        | Retrieved          |

## Day 1 Reflection

1. **Difference:** Retrieved information comes from existing sources; generated information is created by AI.

2. **Better tool:** ChatGPT.
3. **Same response?** No.
4. **Why check aviation facts?** Because incorrect information can affect safety and passengers.
5. **Never enter:** Passport/Aadhaar, booking references, phone numbers, personal emails, payment details or confidential airline information.
6. **How AI helps students:** It can help with research, summaries, presentations, writing and learning.

## Day 2 —

**Traditional AI:** Predicts, classifies, detects, recommends and forecasts.

**Generative AI:** Writes, summarises, rewrites and creates new content.

### Classification

| Task                               | Answer          |
|------------------------------------|-----------------|
| Predict holiday demand             | Traditional AI  |
| Promotional email                  | Generative AI   |
| Detect suspicious bookings         | Traditional AI  |
| Summarise complaints               | Generative AI   |
| Predict delay + draft notification | Both            |
| Decide aircraft safety             | Human judgement |
| Airport campaign ideas             | Generative AI   |
| Forecast airport traffic           | Traditional AI  |
| Approve compensation               | Human judgement |
| Sustainability presentation        | Generative AI   |
| Recommend flight offers            | Traditional AI  |
| Emergency operational decision     | Human judgement |

These classifications follow the lab's stated selection rule and examples.

## Reflection — Day 2

1. **Difference:** Traditional AI predicts/detects/classifies; Generative AI creates content.
2. **Traditional AI example:** Predicting flight delays.
3. **Generative AI example:** Writing a delay message.
4. **Together:** Traditional AI predicts a delay, then Generative AI drafts the passenger notification.
5. **Why check AI?** To verify accuracy and avoid incorrect information.
6. **Human control:** Safety and emergency operational decisions.
7. **Why identify the task first?** To choose the correct AI tool.
